### FEATURES AND BENEFITS

- Innovative stainless steel construction provides superior internal and external corrosion resistance.
- Scotch yoke design using precision bearings eliminates dead band in the yoke mechanism, providing the greatest torque output at the beginning and end of stroke.
- High strength 17-4PH stainless output shaft transmits torque and gives long service life.
- Heat-treated stainless steel thrust pin and rollers transfer piston force to yoke to reduce friction for longer life and more efficient torque transmission.
- Bi-directional travel stops provide accurate valve rotation adjustment.
- PTFE piston bearings, piston rod bushings and output shaft bushings provide longer life, reduce maintenance and require no lubrication.
- Universal design position indicator and pointer allows for either parallel or perpendicular mounting.
- Stainless steel construction allows proximity switches to be direct-mounted in the actuator housing, eliminating the need to mount bracket and cam assemblies on top.
- NAMUR drive slot maintains a compact assembly for accessory-driven components with no couplings necessary.
- Available in symmetrical and canted yoke design to suit application.
- Spring return model design requires no special tools to disarm springs safely and easily, reducing down time.

## DESIGNED WITH A HEART OF STAINLESS STEEL

### **Stainless steel yoke**

The heart of any scotch yoke actuator is the yoke. S series actuators use 17-4PH stainless for this critical area as standard.

The yoke is the mechanism used to convert linear force to torque. This area is most often where the life of the actuator is controlled.

### **Principles of construction**

Using high quality materials of construction and modern rugged design concepts provides the standard for high quality, low cost valve actuation.

The S actuator housings are all machined from 316 stainless steel castings. This produces a rugged, low cost product through reduced machining time and by eliminating wasteful excess material.

Any components that rotate or slide during operation, such as the high strength stainless steel output shaft, stainless steel piston rod, stainless steel thrust pin or the stainless steel piston, are all supported by replaceable friction reducing bearings.

### **Bi-directional travel stops**

Adjustable stops on each end cap provide the flexibility of accurate valve rotation positioning at the end of the 'open' and 'close' stroke. Both stops are located on the cylinder centerline, the optimal position to maximize travel adjustment and eliminate any detrimental side loading on the travel stops. Adjustable from 82° to 98°.

### **Ingress protection**

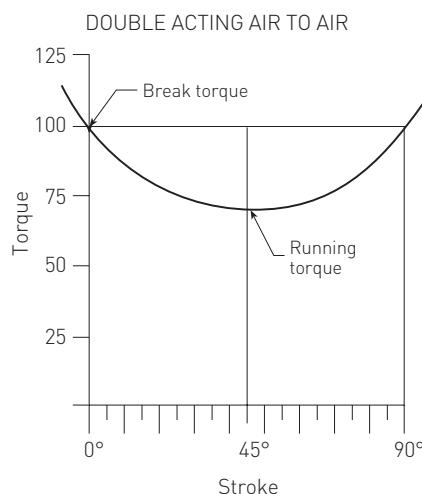

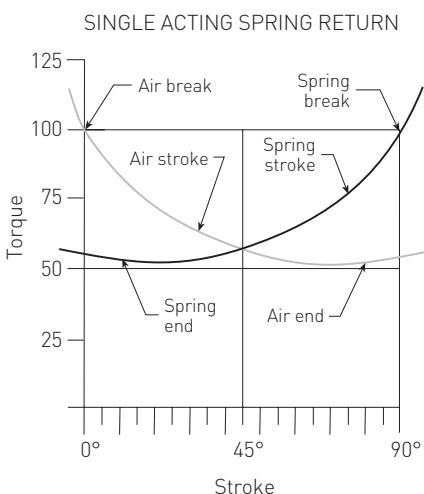

Standard IP66. Optional IP68.

### **Spring designed for safety**

All spring return models incorporate a 'man-safe' spring design that allows the actuator to be safely assembled and disassembled in the field without the need for special tools. The integral tie rods are bored and tapped to provide a means of loading and unloading the spring in a safe and convenient manner.

## SYMMETRICAL AND CANTED YOKES

It's about fitting the torque curve of the actuator to the valve ...

It's about lower cost, lighter weight, smaller actuators ...

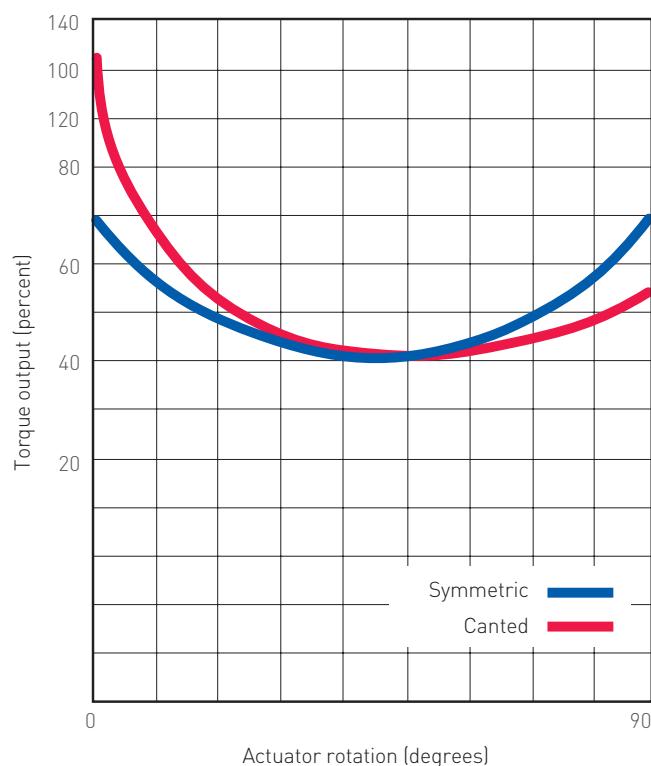

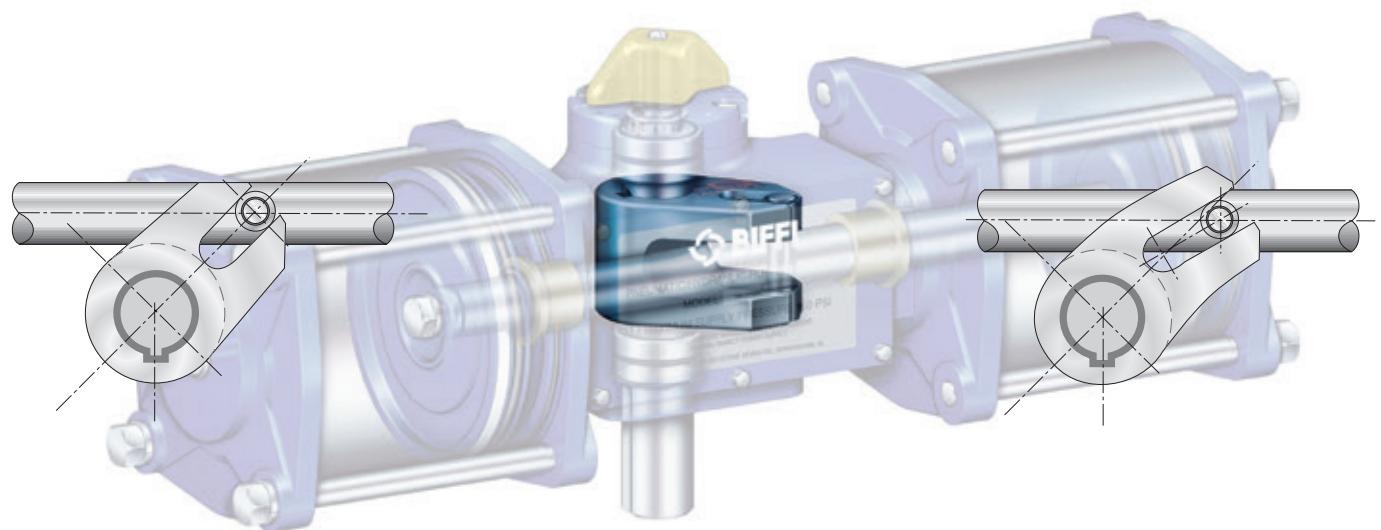

It's about CHOICE ...

### Symmetric

Symmetrical yoke design offers the standard torque curve seen most often in relation to scotch yoke actuators. It offers the increased torque advantage at both ends of the 90° stroke as shown on the blue curve below. This torque curve covers most quarter-turn applications.

### Canted

Canted yoke design moves the torque curve to where it's needed most, gaining as much as 35% more break and reseat torque for the same size actuator. The canted yoke curve is shown in red below. Canted yoke actuators allow selection of smaller, lighter, and less expensive actuator packages.

## NOTES

### 1. Air consumption:

Liter shown in chart represent actual free air volume in cylinder between piston and end cap when furthest apart.

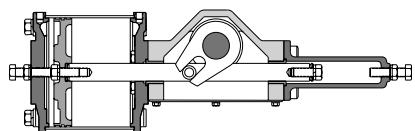

Air consumption will vary depending on supply pressure. To determine standard cubic meter per second use the following formula:

$$\left( \frac{\text{Vol. ltr.}}{1000} \right) \left( \frac{\text{Supply air barg} + 1}{1 \text{ barg}} \right) \left( \frac{\text{Strokes/min.}}{60} \right)$$

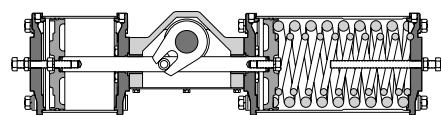

Example: Calculate SCMS for model 023 double acting using 5.5 barg air supply and 5 strokes/minute.

$$\text{SCMS} = \left( \frac{0.737}{1000} \right) \left( \frac{5.5+1}{1 \text{ barg}} \right) \left( \frac{5}{60} \right) = 0.000401$$

- Cycle times shown represent average time to stroke 90 degrees using standard pilot valves and should be used as a guide only. Cycle times can be increased or decreased dramatically by using speed controls, oversized pilot valves or quick exhaust valves.
